Now a days most of the NMR techniques are runned on FT principal. C13 has low isotopic abundance and low gyromagnetic ratio (1/4 to that of proton) hence it is low sensitive.

Assgnmnt no. 2: question is different fractions obtain in crude oil distillation., it's fractions not action... You have to mention in this question fractions like kerosene, diesel, natural gas, naphtha etc with their boiling range and applications. The process of distillation is not asked there. Read question carefully.
